

ADVISORY LEVEL: Important / FAQ

DESCRIPTION: Prop Bolts and Tightening Torque

ENGINE TYPE: R2800 / R3600

Rotec do not supply prop bolts with the engine. This due to the fact that length varies with the thickness of 3rd party props.

The Rotec R2800 uses standard M8 metric bolts. High tensile grade, select a length to suit prop thickness plus allow thread to protrude 13mm past back of hub so a locknut can be used at rear of hub and save using lockwire.

The Rotec R3600 uses 3/8" UNF bolts. Select a length to suit the prop thickness plus allow the thread to protrude 9/16" past back of hub so a locknut can be used at rear of hub and save using lockwire.

Prop Bolt torque 110" Lbs (note in **inch** pounds)
